

# Econ720 - TA Session 4

Yanran Guo

UNC-Chapel Hill

2019. 9. 20

### 3. Problem Set 1 - 1

#### 1. OLG with Arrow-Debreu

- ① Explain why the following is the correct budget constraint:

$$w_t + q_{t+1}s_{t+1} + (1 - \delta)p_{t+1}s_{t+1} = p_t c_t^y + p_{t+1}c_{t+1}^o + p_t s_{t+1}$$

Answer key:

In **date  $t$  market**, rent out labor and earn  $w_t$ , buy capital  $s_{t+1}$  and consumption  $c_t^y$  at price  $p_t$ . In **date  $t+1$  market**, earn rental income  $q_{t+1}s_{t+1}$ , sell the undepreciated capital, and buy  $c_{t+1}^o$  at price  $p_{t+1}$ .

### 3. Problem Set 1 - 1

- 2 Derive the household's FOCs.

Answer key:

$$\mathcal{L} = u(c_t^y) + \beta u(c_{t+1}^o) \\ + \lambda_t(w_t + q_{t+1}s_{t+1} + (1 - \delta)p_{t+1}s_{t+1} - p_t c_t^y - p_t s_{t+1} - p_{t+1} c_{t+1}^o)$$

$$[c_t^y]: u'(c_t^y) = \lambda_t p_t$$

$$[c_{t+1}^o]: \beta u'(c_{t+1}^o) = \lambda_t p_{t+1}$$

$$[s_{t+1}]: p_t = q_{t+1} + (1 - \delta)p_{t+1}$$

### 3. Problem Set 1 - 1

- 3 Define a solution to the household problem.

Answer key:

$(c_t^y, c_{t+1}^o, s_{t+1})$  that satisfy

- Budget Constraint:

$$p_t c_t^y + p_t s_{t+1} + p_{t+1} c_{t+1}^o = w_t + q_{t+1} s_{t+1} + (1 - \delta) p_{t+1} s_{t+1}$$

- Euler Equation:

$$u'(c_t^y) = \frac{p_t}{p_{t+1}} \beta u'(c_{t+1}^o)$$

- No-arbitrage Condition:  $p_t = q_{t+1} + (1 - \delta) p_{t+1}$

### 3. Problem Set 1 - 1

- ④ What is the real interest rate in this economy?

The relative price between consumption at  $t$  and  $t + 1$  is the **real interest rate**.

Answer key:

The real interest rate is  $\frac{p_t}{p_{t+1}}$

- Households can move consumption between dates at the exchange rate  $\frac{p_t}{p_{t+1}}$ .
- It is derived from E.E.

The relative price of two goods = The marginal rate of substitution between these two goods

### 3. Problem Set 1 - 1

- 5 Interpret the condition  $p_t = q_{t+1} + (1 - \delta)p_{t+1}$

Answer key:

It is the **No-arbitrage condition**.

It comes from the equation  $\frac{p_t}{p_{t+1}} = \frac{q_{t+1}}{p_{t+1}} + (1 - \delta)$ .

- The household can move consumption between date  $t$  market and date  $t + 1$  market at exchange rate  $\frac{p_t}{p_{t+1}}$ , which is defined as the real interest rate.
- The household can also move consumption by buying capital and renting it out.  $\frac{q_{t+1}}{p_{t+1}} + (1 - \delta)$  is the return from investing in capital.

Both approaches must yield the same rate of return.

### 3. Problem Set 1 - 1

- 6 State the firm's FOCs. Watch your units!

Answer key:

$$\max p_t F(K_t, L_t) - w_t L_t - q_t K_t$$

$$q_t = p_t F_1(K_t, L_t)$$

$$w_t = p_t F_2(K_t, L_t)$$

### 3. Problem Set 1 - 1

- 7 Define a competitive equilibrium.

Answer key:

Allocations  $\{c_t^y, c_t^o, s_{t+1}, K_t, L_t\}$  and prices  $\{p_t, w_t, q_t\}$  that satisfy

- Household: Euler Equation, No-arbitrage Condition, Budget Constraint
- Firm: F.O.C (2)
- Market Clearing Conditions:
  1. Goods market:  $F(K_t, L_t) = N_t c_t^y + N_{t-1} c_t^o + K_{t+1} - (1 - \delta) K_t$
  2. Capital market:  $N_t s_{t+1} = K_{t+1}$
  3. Labor market:  $L_t = N_t$

### 3. Problem Set 1 - 1

8 Why don't we lose an equation due to Walras' Law?

Answer key:

Neither equation is redundant by Walras' Law. We only lose an equation for one  $t$ .

9 Where is numeraire?

Answer key:

We can make the price of consumption goods at any date  $t$  equal 1.

10 Define a steady state.

Answer key:

At steady state, all **per-capita, real** variables do not change along with time.

Steady state:  $c^y, c^o, k, w/p, q/p, \pi$  that solve the equilibrium conditions without time subscripts.  $\pi_{t+1} = p_{t+1}/p_t$

### 3. Problem Set 1 - 1

- 11 Under what condition do the Welfare theorems hold/fail? Recall that the Welfare theorems require  $\lim_{t \rightarrow \infty} p_t = 0$ .

Answer key:

- Welfare theorems require  $\lim_{t \rightarrow \infty} p_t = 0$ , indicating that price can not explode.
- From no-arbitrage condition ( $\frac{p_t}{p_{t+1}} = \frac{q_{t+1}}{p_{t+1}} + 1 - \delta$ ), no price explosion means  $\frac{p_t}{p_{t+1}} > 1$ , hence  $\frac{q_{t+1}}{p_{t+1}} + 1 - \delta > 1$   
 $\Rightarrow \frac{q_{t+1}}{p_{t+1}} > \delta \Rightarrow \lim_{t \rightarrow \infty} f'(k_{t+1}) > \delta$

### 3. Problem Set 1 - 2

#### 2. OLG with Assets

Demographics: There are two types of households, indexed by  $h$ . In each period, a mass of 0.5 households is born of each type. Each person lives for 2 periods.

→ Heterogeneous agents

Endowments: Households receive endowments  $(e^y, e^o)$  when young and old, respectively.

Preferences:  $\ln(c_{h,t}^y) + \beta_h \ln(c_{h,t+1}^o)$

→ Log utility, hence consumption is a constant fraction of total income.

Technology: None.

→ It's an endowment economy. Hence no capital accumulation.

### 3. Problem Set 1 - 2

Markets: Households trade goods and one period bonds that are issued and purchased by households

→ Sequential trading setup, not Arrow-Debreu. Why?

**What does the budget constraint look like?**

- Sequential trading setup
- No capital accumulation
- Endowment economy with bonds

### 3. Problem Set 1 - 2

$$c_{h,t}^y + b_{h,t+1} = e^y$$

$$c_{h,t+1}^o = (1 + r_{t+1})b_{h,t+1} + e^o$$

Lifetime Budget Constraint:

$$c_{h,t}^y + \frac{c_{h,t+1}^o - e^o}{1 + r_{t+1}} = e^y$$

### 3. Problem Set 1 - 2

- ① Define a solution to the household problem. Solve for the household's bond supply function.

Answer key:

$$\max \ln(c_{h,t}^y) + \beta_h \ln(c_{h,t+1}^o)$$

$$s.t. \quad c_{h,t}^y + b_{h,t+1} = e^y$$

$$c_{h,t+1}^o = (1 + r_{t+1})b_{h,t+1} + e^o$$

$$\mathcal{L} = \ln(c_{h,t}^y) + \beta_h \ln(c_{h,t+1}^o) + \lambda_{h,t} \left( e^y + \frac{e^o}{1 + r_{t+1}} - c_{h,t}^y - \frac{c_{h,t+1}^o}{1 + r_{t+1}} \right)$$

### 3. Problem Set 1 - 2

$$[c_{h,t}^y]: \frac{1}{c_{h,t}^y} = \lambda_{h,t}$$

$$[c_{h,t+1}^o]: \frac{\beta_h}{c_{h,t+1}^o} = \frac{\lambda_{h,t}}{1+r_{t+1}}$$

$$\Rightarrow c_{h,t+1}^o = \beta_h(1+r_{t+1})c_{h,t}^y$$

From budget constraints

$$c_{h,t}^y + \frac{c_{h,t+1}^o}{1+r_{t+1}} = e^y + \frac{e^o}{1+r_{t+1}}$$

$$c_{h,t}^y + \frac{\beta_h(1+r_{t+1})c_{h,t}^y}{1+r_{t+1}} = e^y + \frac{e^o}{1+r_{t+1}}$$

$$c_{h,t}^y = \frac{1}{1+\beta}(e^y + \frac{e^o}{1+r_{t+1}})$$

### 3. Problem Set 1 - 2

Hence

$$\begin{aligned} b_{h,t+1} &= e^y - c_{h,t}^y \\ &= e^y - \frac{1}{1+\beta} \left( e^y + \frac{e^o}{1+r_{t+1}} \right) \\ &= \frac{\beta_h}{1+\beta_h} e^y - \frac{e^o}{(1+\beta_h)(1+r_{t+1})} \end{aligned}$$

Solution: **given**  $r_{t+1}$ ,  $(c_{h,t}^y, c_{h,t+1}^o, b_{h,t+1})$  that satisfy 1 E.E. and 2 BCs.

### 3. Problem Set 1 - 2

- ② Solve for the equilibrium bond interest rate.

Answer key:

We stated the budget constraint as

$$c_{h,t}^y + b_{h,t+1} = e^y$$

$$c_{h,t+1}^o = (1 + r_{t+1})b_{h,t+1} + e^o$$

when  $b_{h,t+1}$  is negative, it means this household is selling bonds;  
when  $b_{h,t+1}$  is positive, it means this household is buying bonds.

In equilibrium, it must be the case that  $\sum_h b_{h,t+1} = 0$ .

### 3. Problem Set 1 - 2

$$\sum b_{h,t+1} = 0$$

$$\sum \left( \frac{\beta_h}{1 + \beta_h} e^y - \frac{e^o}{(1 + \beta_h)(1 + r_{t+1})} \right) = 0$$

$$e^y \sum \frac{\beta_h}{1 + \beta_h} = \frac{e^o}{1 + r_{t+1}} \sum \frac{1}{1 + \beta_h}$$

$$1 + r_{t+1} = \frac{e^o \sum \frac{1}{1 + \beta_h}}{e^y \sum \frac{\beta_h}{1 + \beta_h}}$$

### 3. Problem Set 1 - 2

- 3 Provide intuitions for the features of equilibrium bond interest rate.

Answer key:

(1). If old endowments are larger,  $r$  is higher.

If old endowments are larger, households have less incentive to buy bonds when they are young. Hence bond supply exceeds demand. As a result, the return of bond ( $r_{t+1}$ ) increases, in order to attract more people to buy bonds.

### 3. Problem Set 1 - 2

(2). If  $\beta_h$  increases,  $r$  decreases.

When  $\beta_h$  increases, households become more patient, which also means they value their old consumption more. Hence, households will reduce their young consumption and buy more bonds in order to consume more when they are old. Bond demand exceeds bond supply, leading to a decrease in bond return.  $r_{t+1}$  decreases.

(3). Because of a lack of intergenerational trade,  $r$  is time invariant.

### 3. Problem Set 1 - 2

- 4 Now add a durable good to the economy. It is in fixed supply,  $K$ . It pays a dividend  $d$  per period (in units of consumption goods). Households trade shares of this good in an asset market at price  $p_t$ , **measured in units of consumption goods**. Define a competitive equilibrium for this economy.

Answer key:

$$\max \ln(c_{h,t}^y) + \beta_h \ln(c_{h,t+1}^o)$$

$$\text{s.t. } c_{h,t}^y + b_{h,t+1} + p_t k_{h,t+1} = e^y$$

$$c_{h,t+1}^o = (1 + r_{t+1})b_{h,t+1} + dk_{h,t+1} + p_{t+1}k_{h,t+1} + e^o$$

### 3. Problem Set 1 - 2

$$\mathcal{L} = \ln(c_{h,t}^y) + \beta_h \ln(c_{h,t+1}^o) \\ + \lambda_{h,t} \left( e^y + \frac{e^o}{1+r_{t+1}} - c_{h,t}^y - \frac{c_{h,t+1}^o}{1+r_{t+1}} - \left( p_t - \frac{p_{t+1}+d}{1+r_{t+1}} \right) k_{h,t+1} \right)$$

$$\text{E.E. } \frac{c_{h,t+1}^o}{c_{h,t}^y} = \beta_h (1+r_{t+1})$$

$$\text{No-arbitrage condition: } 1+r_{t+1} = \frac{p_{t+1}+d}{p_t}$$

### 3. Problem Set 1 - 2

Competitive equilibrium:

Allocations  $\{c_{h,t}^y, c_{h,t}^o, b_{h,t+1}, k_{h,t+1}\}$  and prices  $\{r_t, p_t\}$  that satisfy

- Household problem: E.E. (2), BC (4);

- Market clearing condition:

Goods market:  $e^y + e^o + dK = 0.5 \sum c_{h,t}^y + 0.5 \sum c_{h,t}^o$

Bonds market:  $\sum b_{h,t+1} = 0$

Durable Good Market:  $0.5 \sum k_{h,t+1} = K$

- No-arbitrage Condition:  $1 + r_{t+1} = \frac{p_{t+1} + d}{p_t}$

10 objects, 10 equations

### 3. Problem Set 1 - 2

- 5 Why do you find that the number of equations equals the number of objects to be determined? Usually, we find that we have one additional equation, which is redundant by Walras' law.

Answer key:

Because due to No-arbitrage condition, the real return of bonds is equal to the real return of durable goods, hence households do not need to specify the particular amount of  $b_{h,t+1}$  and  $k_{h,t+1}$ , and can put them into one portfolio.

### 3. Problem Set 1 - 2

- 6 Derive an equation that determines the equilibrium price sequence  $p_t$ .

### 3. Problem Set 1 - 2

#### Logic

- Equation for price sequence  
→ Equation that shows the relationship between today's  $p$  and tomorrow's  $p$ :  $F(p_t, p_{t+1})$
- Which equilibrium condition contains both  $p_t$  and  $p_{t+1}$   
→ No-arbitrage condition
- Which condition can be further developed using no-arbitrage condition?  
→ Lifetime budget constraint
- Two endogenous variables  $c_{h,t}^y$  and  $c_{h,t+1}^o$ , how to get rid of one?  
→ E.E.
- Equation for  $c_{h,t}^y$   
→ Which condition contains  $c_{h,t}^y$
- How to take  $b_{h,t+1}$  away from B.C. for young?
- How to take  $k_{h,t+1}$  away from B.C. for young?

### 3. Problem Set 1 - 2

Answer key:

In equilibrium,  $1 + r_{t+1} = \frac{p_{t+1} + d}{p_t}$ . Hence the life-time budget constraint of household

$$e^y + \frac{e^o}{1 + r_{t+1}} = c_{h,t}^y + \frac{c_{h,t+1}^o}{1 + r_{t+1}} + \left(p_t - \frac{p_{t+1} + d}{1 + r_{t+1}}\right) k_{h,t+1}$$

becomes

$$e^y + \frac{e^o}{1 + r_{t+1}} = c_{h,t}^y + \frac{c_{h,t+1}^o}{1 + r_{t+1}}$$

### 3. Problem Set 1 - 2

Substituting Euler Equation  $\frac{c_{h,t+1}^o}{c_{h,t}^y} = \beta_h(1+r_{t+1})$  into life-time budget constraint,

$$c_{h,t}^y = \frac{e^y + \frac{e^o}{1+r_{t+1}}}{1+\beta_h} = \frac{e^y + \frac{e^o p_t}{p_{t+1}+d}}{1+\beta_h}$$

From the durable goods market clearing condition

$$\begin{aligned} 2K &= \sum k_{h,t+1} \\ 2p_t K &= \sum p_t k_{h,t+1} \\ &= \sum p_t k_{h,t+1} + \sum b_{h,t+1} \\ &= 2e^y - \sum c_{h,t}^y \\ &= 2e^y - \sum \frac{e^y + \frac{e^o p_t}{p_{t+1}+d}}{1+\beta_h} \end{aligned}$$
